

WHAT DOES YOUR COVID-19 ANTIBODY TEST RESULT MEAN?

WHAT DOES IT MEAN IF I HAVE A **POSITIVE** TEST RESULT?

If you have a positive test result, it is likely that you have or previously had COVID-19 and that you have developed an antibody response to the virus.

WHAT DOES IT MEAN IF I HAVE A **NEGATIVE** TEST RESULT?

A negative test result indicates you most likely have not had exposure to COVID-19 or that your body has not created a strong enough response to create detectable antibodies.

WHAT DOES THE NUMBER IN THE TEST RESULT MEAN?

The number indicates the strength of reaction, meaning the number of antibodies you have developed. The number is helpful in identifying patterns and trends. It can take several days for a person to develop antibodies after testing positive for COVID-19 or having a known exposure.

HOW LONG AFTER INFECTION SHOULD I BE TESTED?

Our test is optimal at least 14 days after infection/resolution. Many patients begin to build antibodies sooner than 14 days after infection, however, we recommend waiting 14 days to ensure the most accurate possible results.

WHAT IS THE TEST PERFORMANCE?

Our laboratories internal studies have agreed with the overall listed performance with the FDA which is that the sensitivity and specificity are 97.6% and 99.3% respectively.

WHAT DOES YOUR COVID-19 PCR (ACTIVE) TEST RESULT MEAN?

WHAT DOES IT MEAN IF I HAVE A **NEGATIVE** PCR (ACTIVE) COVID-19 TEST?

- A negative test result means that the virus that causes COVID-19 was not found in your sample.
- For COVID-19, a negative test result for a sample collected while a person has symptoms usually means that COVID-19 did not cause your recent illness.
- It is possible for this test to give a negative result that is incorrect (false negative) in some people with COVID-19. This means that you could possibly still have COVID-19 even though the test is negative. If this is the case, your healthcare provider will consider the test result together with all other aspects of your medical history (such as symptoms, duration of illness, possible exposures, etc.) in deciding how to care for you.
- It is important that you work with your healthcare provider to help you understand the next steps you should take.

WHAT DOES IT MEAN IF I HAVE A **POSITIVE** PCR (ACTIVE) COVID-19 TEST?

- If you have a positive test result, it is likely that you have COVID-19.
- It is likely that you may be placed in isolation to avoid spreading the virus to others.
- There is a very small chance that this test can give a positive result that is inaccurate (a false positive result).
- Your healthcare provider will work with you to determine how best to care for you based on the test results along with other factors of your medical history.
